CHAPTER 2 Protein Structure 31 Side Chains with Polar but Uncharged Groups Six amino acids have side chains with polar groups (FIGURE 2.4). Asparagine and glutamine are amide derivatives of aspartate and glutamate, respectively. Serine, threonine, and tyrosine have side chains with hydroxyl ( $\text{-OH}$ ) groups.

### **SECTION Protein Structure and Function I**

The cell (from Latin *cella*, meaning "small room") is the basic structural, functional, and biological unit of all known living organisms. A cell is the smallest unit of life. Cells are often called the "building blocks of life". The study of cells is called cell biology. Cells consist of cytoplasm enclosed within a membrane, which contains many biomolecules such as proteins and nucleic acids.

Unit cell. Crystal structure is described in terms of the geometry of arrangement of particles in the unit cell. The unit cell is defined as the smallest repeating unit having the full symmetry of the crystal structure. The geometry of the unit cell is defined as a parallelepiped, providing six lattice parameters taken as the lengths of the cell edges ( $a$ ,  $b$ ,  $c$ ) and the angles between them ( $\alpha$ ,  $\beta$ ,  $\gamma$  ...)

Learning Objectives By the end of this chapter you should appreciate that: n the components of the nervous system have specific functional roles; n there is regional specialization within the brain; n nerve cells (neurons) have to use energy to maintain their electrical potential gradients, and that neurons  $\rightarrow$  react  $\rightarrow$  through the generation of action potentials which perturb these gradients;

### **The Nervous System 3 - Wiley-Blackwell**

CELL SHAPE Cells come in a variety of shapes  $\neq$  depending on their function:- The neurones from your toes to your head are long and thin; Blood cells are rounded disks, so that they can flow smoothly.

### **INTRODUCTION TO THE CELL - BiologyMad A-Level Biology**

Folding, modification, and degradation of proteins The life of a protein can briefly be described as: synthesis, folding, modification, function, degradation.

Reidenbach et al. discover small-molecule and lipid ligands for the atypical kinase-like protein COQ8 that enhance its ATPase activity. They develop an analog-sensitive version of COQ8 that can be covalently inhibited, enabling acute inhibition of COQ8 ATPase activity in vitro and coenzyme Q biosynthesis in vivo.

Lacing. Lacing is a mechanism to save space when storing data. It is typically used for small blocks of data (referred to as frames in matroska). There are 3 types of lacing : the Xiph one inspired by what is found in the Ogg container, the EBML one which is the same with sizes coded differently and the fixed-size one where the size is not coded.

## An Introduction to Chemistry

The line bar = foo does not copy the contents of the variable, only its "object reference". To understand what is going on here, we need to know how lists are stored in the computer's memory. In 4.1, we see that a list foo is a reference to an object stored at location 3133 (which is itself a series of pointers to other locations

holding strings). When we assign `bar = foo`, it is just the ...
