Lumber (American English; used only in North America) or timber (used in the rest of the English-speaking world) is a type of wood that has been processed into beams and planks, a stage in the process of wood production. Lumber is mainly used for structural purposes but has many other uses as well. There are two main types of lumber. It may be supplied either rough-sawn, or surfaced on one or ...

A growing family of MXenes, i.e., layered transition metal carbides and/or nitrides, has been becoming an important candidate of electrode material for new-concept energy storage devices due to their unique properties. This article timely and comprehensively reviewed state-of-the-art progress on electrochemical performance and mechanism of MXenes and their hybrids containing small molecules ...

Graphene-like two-dimensional (2D) transition metal dichalcogenides (TMDCs) have been attracting a wide range of research interests. Molybdenum disulfide (MoS₂) is one of the most typical TMDCs. Its particular direct band gap of 1.8 eV in monolayer and layer dependence of band structure tackle the gapless problems of graphene, thus making it scientific and industrial importance.

Description and characteristics. In fluid dynamics, a potential flow is described by means of a velocity potential ϕ , being a function of space and time. The flow velocity v is a vector field equal to the gradient, $\hat{v} = \nabla\phi$, of the velocity potential ϕ : $v = \nabla\phi$. Sometimes, also the definition $v = -\nabla\phi$, with a minus sign, is used. But here we will use the definition above, without the minus sign.
