Quantum optics (QO) is a field of research that uses semi-classical and quantum-mechanical physics to investigate phenomena involving light and its interactions with matter at submicroscopic levels. In other words it is quantum mechanics applied to photons or light.

### **Quantum optics - Wikipedia**

In theoretical physics, quantum field theory (QFT) is a theoretical framework that combines classical field theory, special relativity, and quantum mechanics:  $\psi$  and is used to construct physical models of subatomic particles (in particle physics) and quasiparticles (in condensed matter physics).. QFT treats particles as excited states (also called quanta) of their underlying fields, which are ...

First, let's consider how probabilities are ordinarily computed: When an event consists of two mutually exclusive events, its probability is the sum of the probabilities of those two events. Similarly, when an event is the conjunction of two statistically independent events, its probability is the product of the probabilities of those two events. ...

These operators will "operate" on a wave function,  $\psi$ , which is assumed to exist, and which is assumed to contain all that is knowable about the quantum mechanical system. We would then solve the resulting equation to get the particulars. And so, in this example, we can write the substitutions into the classical expression for total energy.

The over-arching presumption in modern science and philosophy is that consciousness emerges from complex synaptic computation in networks of brain neurons acting as fundamental information units.

Modern logic is a symbolic formalization of naive Aristotelian logic. Aristotle's categories are sets which can be members of other sets, under strict rules.
