Digital Signal Processing: Pearson New International

The most common processing approach in the time or space domain is enhancement of the input signal through a method called filtering. Digital filtering generally consists of some linear transformation of a number of surrounding samples around the current sample of the input or output signal. There are various ways to characterize filters; for example:

In digital signal processing, downsampling and decimation are terms associated with the process of resampling in a multi-rate digital signal processing system. Both terms are used by various authors to describe the entire process, which includes lowpass filtering, or just the part of the process that does not include filtering. When downsampling (decimation) is performed on a sequence of ...

El Procesamiento de Señales Digitales o DSP (sigla en inglés de Digital Signal Processing) es la manipulación matemática de una señal de información para modificarla o mejorarla en algún sentido. Este está caracterizado por la representación en el dominio del tiempo discreto, en el dominio frecuencia discreta, u otro dominio discreto de señales por medio de una secuencia de números o ...

@mujtaba: Yes, there is an advantage in using root raised cosine in receiver. Typical receivers have additive white gaussian noise and matched filtering helps one to maximize the signal to noise ratio in that scenario.

The theoretical symbol error rate for 16-QAM modulation is derived for additive white gaussian noise channel, further elaborated using Matlab/Octave simulation script.
