Thus, the twisted octonions do not satisfy $N(ab) = N(a)N(b)$, and furthermore, the logical equivalence of the multiplicative norm and the octonions' associativity pattern is revealed. An examination of the automorphism group of the twisted octonions reveals some interesting features.

The noncommutative relation Eq.(1.2) breaks Lorentz symmetry as previously mentioned. Lorentz symmetry is one of the most important symmetry in physics. We have not had any experimental evidence of the violation of the symmetry, even though it has been tested intensively in many ways. If there is no Lorentz symmetry, we immediately face difficulties.

applications to number theory, combinatorics and especially to symmetry theory of geometrical figures there are many fascinating applications to explore. The focus here is the exploration of the application of group theory in symmetry theory. Symmetry of an object is a transformation that leaves the object unchanged.
